

INTRODUCTION

Extend the service life of equipment in situations where abrasive blasting is not suitable or available.

A correctly applied repair to a surface coating system will extend service life and help improve operating performance. Our technicians are all trained and certified in the repair of coating systems and have a vast array of experience; from basic spot repairs to full asset re-coatings.

FEATURES

- Blast media-free cleaning - bristle blasting method used
- Rapid spot repair to small and medium sized areas
- Delivers significant time and cost saving on component repair versus complete strip down, blast and recoat
- Minimises or eliminates the need for component disassembly - no need to remove hydraulic pipes and actuators
- Eliminates contamination problems and damage often experienced from grit blasting partially assembled components and equipment
- Work can be carried in-situ or at one of our sites
- Minimal environmental control required

PROPERTIES

Surface Preparation	- Mask off areas that do not require coating and - Mechanically remove visible corrosion - Surface is prepared to ST2-ST3 in accordance with standard ISO8501-1
Coating Application	- The coating system is applied as per customer specification - Norsok M 501 approved paint systems can be applied to spot corrosion damaged areas. The entire structure can be top coated after preservation treatment of the damaged areas is complete
Logistics	- Repairs can be conducted without significant disassembly and can be completed in-situ or at a Surface Technology site

APPLICATIONS

Christmas Trees, Choke Module Running Tools, Reelers, Wire Line Units, Shipping Containers and Skids, repair of transport damage on new equipment.
